mp3 file. It keeps saying that file is corrupt. I have tried in Windows7 and Windows8. I can use it in other TRACKSSTREAM5RA.rtf files without problems. I have used Transcriber 3.0.20 on the computer. (I have also used older version of this software and it works fine). In Windows7 I have tried to burn it to a CD and then transfer it to the new laptop. The error still appears. Also tried to copy and paste the content to the new folder. Is there a chance to solve this problem? A: This file seems to be the result of a write error. You should be able to repair it by moving the file to another location then copying it back to the original location. This seems to be a corruption of the file. Try copying it to a new folder. . For example, in the context of longitudinal studies, a biased measurement of exposure may impact on the probability of experiencing the outcome. The present work explores this possibility, and it shows that the sensitivity of results to the initial state is primarily dependent on the extent of exposure to the selected outcome. Although our simulation study was not designed to explore any precise mechanism, we can suggest that two processes may play a role. First, exposure to the initial state may impact on the probability of later exposure to the selected outcome. In the absence of any bias, such a mechanism would tend to increase, or at least maintain, the within-study risk, making the results more conservative. Second, although, in a study with a short follow-up, the exposure to the initial state would be null, the time of the measurement of exposure may impact on the probability of later experiencing the outcome. As mentioned above, the result of a longitudinal study does not depend on any single type of bias but is influenced by a range of biases acting in different directions. A strength of the simulation study is that it illustrates a situation where the sensitivities are similar to the one considered in most published longitudinal studies. Although the results are relatively general, the chosen parameters may not represent the situation in all settings. For example, the outcome exposure is assumed to be completely or partially unmeasured, and the role of selection bias on the conditional probabilities of exposure and outcome is not modeled. Further work is needed to better understand 82157476af
